NEW QUESTION: 2

After publishing an Android MDX application, a Citrix Engineer finds that the application only installs on devices running Android OS 4.3 and above, instead of all Android devices.

What is the likely cause of this issue?

A. The certificate used to wrap the application uses SHA1 and DSA Signing algorithms.

B. The key used on the certificate to wrap the application uses a DSA key algorithm.

C. The certificate used to wrap the application has expired.

D. The key size of the certificate used to wrap the application is 2048 bits.

Answer: D

NEW QUESTION: 3

A user has launched an EBS backed EC2 instance.

The user has rebooted the instance.

Which of the below mentioned statements is not true with respect to the reboot action?

A. The volume is preserved

B. The instance runs on a new host computer

C. The private and public address remains the same

D. The Elastic IP remains associated with the instance

Answer: B

Explanation:

A user can reboot an EC2 instance using the AWS console, the Amazon EC2 CLI or the Amazon EC2 API. Rebooting an instance is equivalent to rebooting an operating system. However, it is recommended that the user use the Amazon EC2 to reboot the instance instead of running the operating system reboot command from the instance. The instance remains on the same host computer and maintains its public DNS name, private IP address, and any data on its instance store volumes. It typically takes a few minutes for the reboot to complete, but the time it takes to reboot depends on the instance configuration.
