NEW QUESTION: 3

Kerberos provides an integrity check service for messages between two entities through the use of:

- A. A checksum
- B. Credentials
- C. Tickets
- D. A trusted, third-party authentication server

Answer: A

Explanation:

A checksum that is derived from a Kerberos message is used to verify

the integrity of the message. This checksum may be a message digest

resulting from the application of a hash function to the message. At the receiving end of the transmission, the

receiving party can calculate the message digest of the received message using the identical hash algorithm as the

sender. Then the message digest calculated by the receiver can be compared with the message digest appended to the message by the sender. If the two message digests match, the message has not been

modified en route, and its integrity has been preserved.

For answers Credentials and Tickets are authenticators used in the process of granting user access to services on the network.

Answer "A trusted, third-party authentication server" is the AS or authentication server that conducts the ticket-granting process.
