NEW QUESTION: 1

An operating system (OS) noncritical patch to enhance system security cannot be applied because a critical application is not compatible with the change. Which of the following is the BEST solution?

- A. Run the application on a test platform; tune production to allow patch and application
- B. Compensate for not installing the patch with mitigating controls
- C. Rewrite the application to conform to the upgraded operating system
- D. Alter the patch to allow the application to run in a privileged state

Answer: B

Explanation:

Explanation

Since the operating system (OS) patch will adversely impact a critical application, a mitigating control should be identified that will provide an equivalent level of security. Since the application is critical, the patch should not be applied without regard for the application; business requirements must be considered. Altering the OS patch to allow the application to run in a privileged state may create new security weaknesses. Finally, running a production application on a test platform is not an acceptable alternative since it will mean running a critical production application on a platform not subject to the same level of security controls.

NEW QUESTION: 2

- A. `CustomError.customError = true;`
- B. `CustomError.prototype = Error.prototype;`
- C. `Error-constructor = CustomError;`
- D. `CustomError ["ErrorType"] = Error;`

Answer: B

Explanation:

Explanation: * Object.prototype.constructor

Returns a reference to the Object function that created the instance's prototype. Note that the value of this property is a reference to the function itself, not a string containing the function's name. The value is only read-only for primitive values such as 1, true and "test".

* The constructor property is created together with the function as a single property of func.prototype.

Reference: Object.prototype.constructor

NEW QUESTION: 3

Which of the following are the most important factors to be taken into account when selecting test techniques?

- (i) Tools available.
- (ii) Regulatory standards.
- (iii) Experience of the development team.
- (iv) Knowledge of the test team.

The need to maintain levels of capability in each technique.

- A.** (i) and (ii)
- B.** (i) and (v)
- C.** (ii) and (iv)
- D.** (iii) and (iv)

Answer: C

Explanation:

Answer (i) looks temptingly right, and the availability of tools might make the use of a technique more or less attractive, but it would not be decisive in the way that regulatory standards and tester knowledge are.

Answer (iii) is irrelevant because testing should be independent of development anyway, but it could tempt someone who is unsure about the relationship between development and testing.

Answer (v) is a factor in managing the test team, and experience would need to be maintained, but this should not influence the selection of techniques for a live project.
