NEW QUESTION: 3

SWITCH.com is an IT company that has an existing enterprise network comprised of two layer 2 only switches; DSW1 and ASW1.

The topology diagram indicates their layer 2 mapping. VLAN 20 is a new VLAN that will be used to provide the shipping personnel access to the server. Corporate policies do not allow layer 3 functionality to be enabled on the switches. For security reasons, it is necessary to restrict access to VLAN 20 in the following manner:

* Users connecting to VLAN 20 via portf0/1 on ASW1 must be authenticated before they are given access to the network.

Authentication is to be done via a Radius server:

* Radius server host: 172.120.40.46

- * Radius key: rad123
- * Authentication should be implemented as close to the host as possible.
- * Devices on VLAN 20 are restricted to the subnet of 172.120.40.0/24.
- * Packets from devices in the subnet of 172.120.40.0/24 should be allowed on VLAN 20.
- * Packets from devices in any other address range should be dropped on VLAN 20.
- * Filtering should be implemented as close to the serverfarm as possible.

The Radius server and application servers will be installed at a future date.
