NEW QUESTION: 1

Sie haben zwei Datenbanktabellen. Tabelle1 ist eine

partitionierte Tabelle und Tabelle 2 ist eine nicht partitionierte Tabelle.

Benutzer berichten, dass das Abschließen von Abfragen viel Zeit in Anspruch nimmt. Sie überwachen Abfragen mithilfe von Microsoft SQL Server Profiler. Sie beobachten die Sperreneskalation für Tabelle1 und Tabelle 2.

Sie müssen die Eskalation von Table1-Sperren auf die Partitionsebene zulassen und die Eskalation aller Sperren für Table2 verhindern.

Welche Transact-SQL-Anweisung sollten Sie für jede Tabelle ausführen? Ziehen Sie zum Beantworten die entsprechenden Transact-SQL-Anweisungen in die richtigen Tabellen. Jeder Befehl kann einmal, mehrmals oder gar nicht verwendet werden. Möglicherweise müssen Sie die geteilte Leiste zwischen den Fenstern ziehen oder einen Bildlauf durchführen, um den Inhalt anzuzeigen.

Answer:

Explanation

Since SQL Server 2008 you can also control how SQL Server performs the Lock Escalation - through the ALTER TABLE statement and the property LOCK_ESCALATION. There are 3 different options available:

Box 1: Table1, Auto

The default option is TABLE, means that SQL Server *always* performs the Lock Escalation to the table level -even when the table is partitioned. If you have your table partitioned, and you want to have a Partition Level Lock Escalation (because you have tested your data access pattern, and you don't cause deadlocks with it), then you can change the option to AUTO. AUTO means that the Lock Escalation is performed to the partition level, if the table is partitioned, and otherwise to the table level.

Box 2: Table 2, DISABLE

With the option DISABLE you can completely disable the Lock Escalation for that specific table.

For partitioned tables, use the LOCK_ESCALATION option of ALTER TABLE to escalate locks to the HoBT level instead of the table or to disable lock escalation.

- D. \$6 million

Answer: B

NEW QUESTION: 3

You have a server named Server 2 that runs Windows Server 2012. Server 2 has the Hyper-V server role installed. The disks on Server2 are configured as shown in the exhibit. You create a virtual machine on Server2 named VM1. You need to ensure that you can configure a pass-through disk for VM1. What should you do?

- A. Convert Disk 1 to a basic disk.
- B. Take Disk 1 offline.
- C. Create a partition on Disk 1.
- D. Convert Disk 1 to a MBR disk.

Answer: B

Explanation:

<http://blogs.technet.com/b/askcore/archive/2008/10/24/configuring-pass-through-disks-in-hyper-v.aspx>

Hyper-V allows virtual machines to access storage mapped directly to the Hyper-V server without requiring the volume be configured. The storage can either be a physical disk internal to the Hyper-V server or it can be a Storage Area Network (SAN) Logical Unit (LUN) mapped to the Hyper-V server. To ensure the Guest has exclusive access to the storage, it must be placed in an Offline state from the Hyper-V server perspective.

Additionally, this raw piece of storage is not limited in size so, hypothetically, it can be a multi-terabyte LUN.
