- C. ACL
- D. AD

Answer: B,D

NEW QUESTION: 2

Which two choices are valid Cisco TrustSec topologies? (Choose two)

- A. EAP
- B. wireless multipoint
- C. wireless
- D. point-to-point
- E. point-to-multipoint
- F. wireless point-to-point

Answer: C,D

NEW QUESTION: 3

Which option is a core event publisher for EEM?

- A. Script
- B. Timer
- C. Applet
- D. Policy Director

Answer: B

Explanation:

EEM is a flexible, policy-driven framework that supports in-box monitoring of different components of the system with the help of software agents known as event detectors. The figure below shows the relationship between the EEM server, core event publishers (event detectors), and the event subscribers (policies). Basically, event publishers screen events and publish them when there is a match on an event specification that is provided by the event subscriber. Event detectors notify the EEM server when an event of interest occurs. The EEM policies that are configured using the Cisco command-line interface (CLI) then implement recovery on the basis of the current state of the system and the actions specified in the policy for the given event. EEM offers the ability to monitor events and take informational or corrective action when the monitored events occur or when a threshold is reached. An EEM policy is an entity that defines an event and the actions to be taken when that event occurs. There are two types of EEM policies: an applet or a script. An applet is a simple form of policy that is defined within the CLI configuration. A script is a form of policy that is written in Tool Command Language (Tcl).
